

Hypertension Clinical Playbook

The definitive visual guide to diagnosis, stepped-care pharmacotherapy, and special population management.

INITIALIZE PATHWAY

The Silent Epidemic: Australian Burden

34% (6 million) of Australian adults have hypertension.

1 in 3 adults with hypertension are completely unaware of their condition.

AIHW DATA - DOWNSTREAM IMPACT

28%

of all Cardiovascular Events

37%

of Ischaemic Heart Disease

35%

of Stroke Burden

Diagnostic Protocols: Defining the Metric

The Diagnostic Measurement Matrix

Office BP

Threshold:
 $\geq 140/90$ mmHg

Protocol:

Rest ≥ 5 min, back supported, arm at heart level. 2 readings, 1-2 min apart.
Use higher arm if difference > 20 mmHg.

Home BP (HBPM)

Threshold:
 $\geq 135/85$ mmHg

Protocol:

7 consecutive days, AM & PM. Discard Day 1.

Cost:

~\$100 (consumer).

GOLD STANDARD

Ambulatory BP (ABPM)

24h Threshold:
 $\geq 130/80$ mmHg

Day:

$\geq 135/85$

Night:

$\geq 120/70$

Note: Non-dipping ($< 10\%$ nocturnal fall) = high CV risk.

Cost: Out-of-pocket (No MBS item).

The Masked Danger: Identifying Hidden Risk

Office BP	Elevated	White Coat HTN <ul style="list-style-type: none">• 15-20% prevalence.• Low-moderate risk.• Lifestyle/monitoring only.	Sustained HTN
	Normal	True Normotension	Masked HTN <ul style="list-style-type: none">• 10-15% prevalence.• High CV risk.• Requires active pharmacotherapy.
		Normal	Elevated
		Out-of-Office BP	

Actively screen for Masked HTN in patients with diabetes, CKD, OSA, or smoking history using HBPM.

Baseline Diagnostic Workup

Essential Baselines

- ✓ Serum electrolytes, creatinine, eGFR
MBS:66511 (Detects hypokalaemia/CKD)
- ✓ Urinalysis (Urine ACR)
MBS:66515 (Screens for albuminuria)
- ✓ Fasting lipids
MBS:66511 (CV risk)
- ✓ Fasting glucose/HbA1c
MBS:66511/66551 (Diabetes screen)

Available/Referral Investigations

- i 12-lead ECG
MBS:11700 (LVH, ischaemia)
- i Fundoscopy
(Retinopathy)
- i Echocardiography
MBS:55114 (If LVH suspected)

Calculate 5-year ACVD risk to contextualize BP management.

Defining the Target: Profile-Driven Goals

General Adult

<130/80

(Evidence: SPRINT, 2017 ACC/AHA)

Diabetes

<130/80

(ACEi/ARB preferred)

CKD

<130/80

(ACEi/ARB mandatory if ACR ≥ 30)

Post-Stroke / TIA

<130/80

(Commence >48h post-ischaemic)

Elderly <80

<130/80

(Individualize based on frailty)

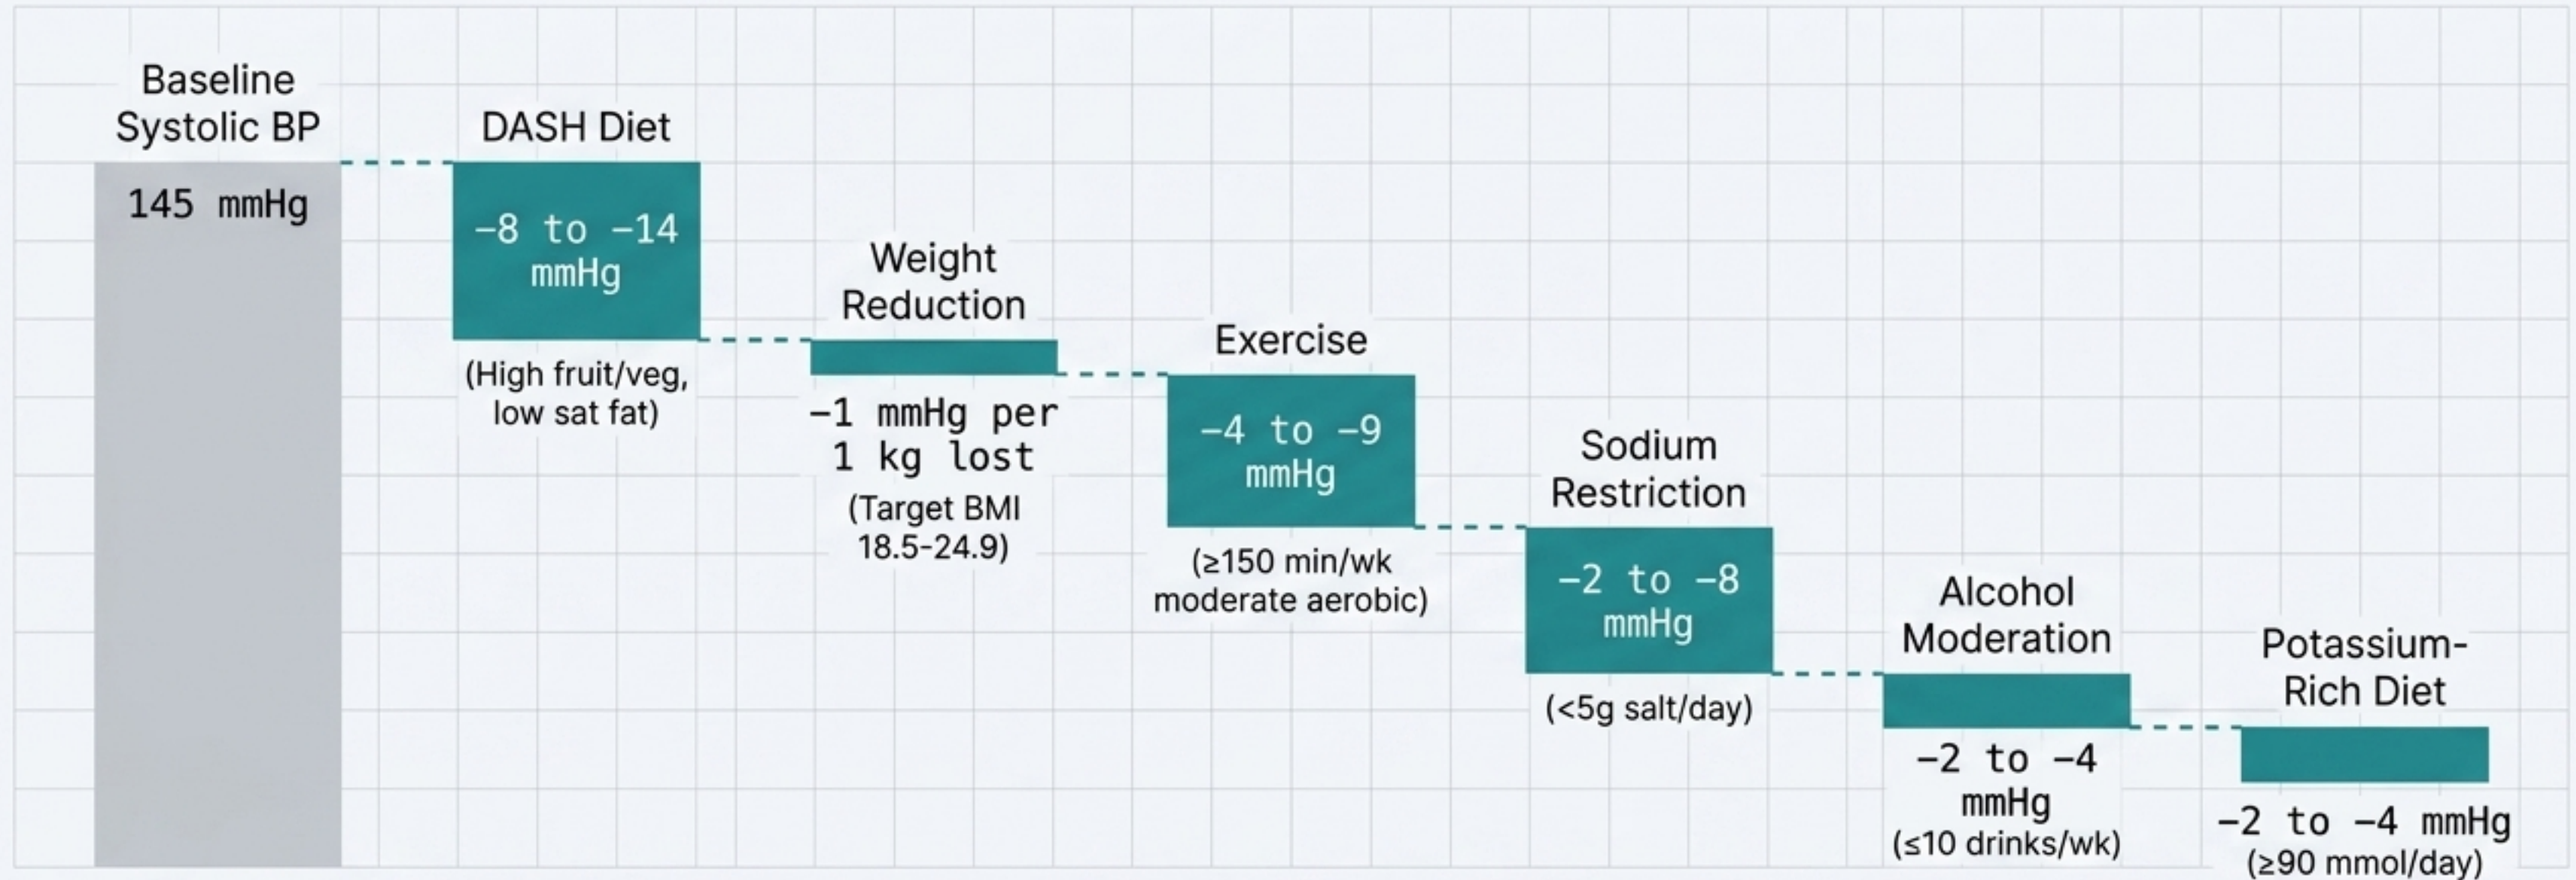

Elderly ≥ 80

130–149 / <80

(Avoid aggressive targeting to prevent falls)

The Baseline Intervention: Quantifying Lifestyle

Baseline Systolic BP

Waterfall Chart

Combined lifestyle modifications can equal or exceed the efficacy of dual-pharmacotherapy.

The Arsenal: First-Line Pharmacotherapy

The First-Line Arsenal Matrix

Class	Example / Starting Dose	Renal Rules	Hepatic Rules	PBS Status
ACE Inhibitor	Perindopril 5mg to 10mg OD	Start 2.5mg if eGFR<30.	-	General
ARB	Irbesartan 150-300mg OD / Telmisartan 40-80mg OD	No dose adjustment, monitor K+/eGFR.	-	General
DHP-CCB	Amlodipine 5mg to 10mg OD	No dose adjustment required.	Start 2.5mg in severe impairment.	General
Thiazide-like	Indapamide 1.5mg SR OD	Contraindicated if eGFR <15 (anuria).	-	General

Prescribing Principle: Start single agent at low dose, titrate over 4-8 weeks. If target not reached, add a second agent from a different class.

Escalation: The Single-Pill Advantage

Context: For patients $\geq 20/10$ mmHg above target or Stage 2 HTN, initiate dual therapy immediately.

"The Single-Pill Advantage" Model

Available PBS-Listed Combos

- Coveram: Perindopril + Amlodipine (5/5 to 10/10)
- Karvea Combo: Irbesartan + Hydrochlorothiazide (150/12.5 to 300/12.5)
- Twynsta: Telmisartan + Amlodipine (40/5 to 80/10)

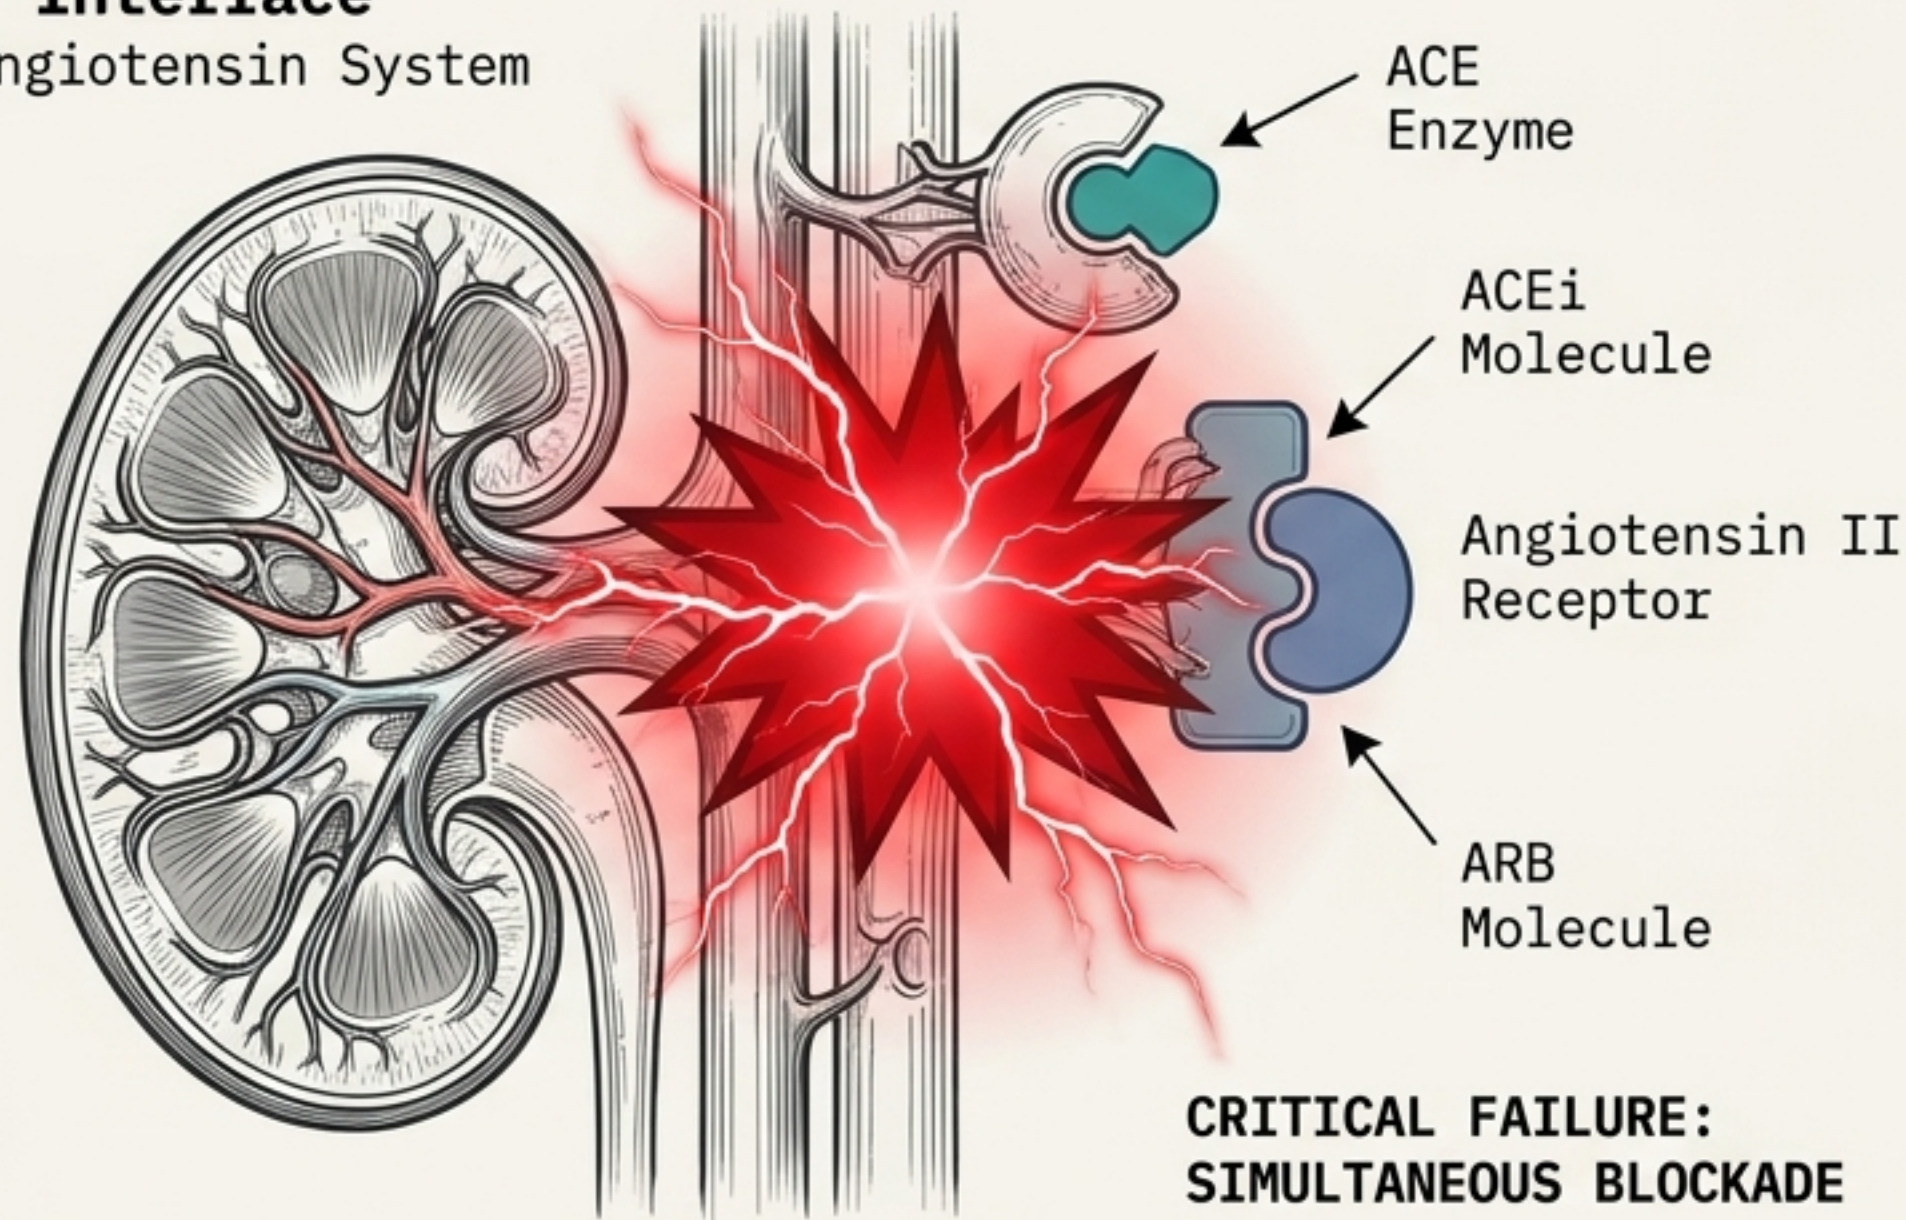

Key Insight: Single-pill combinations (SPCs) drastically reduce pill burden and stabilize long-term adherence curves.

The Fatal Combo: Absolute Contraindication

NEVER COMBINE AN ACE-i WITH AN ARB.

Kidney Interface

Renin-Angiotensin System

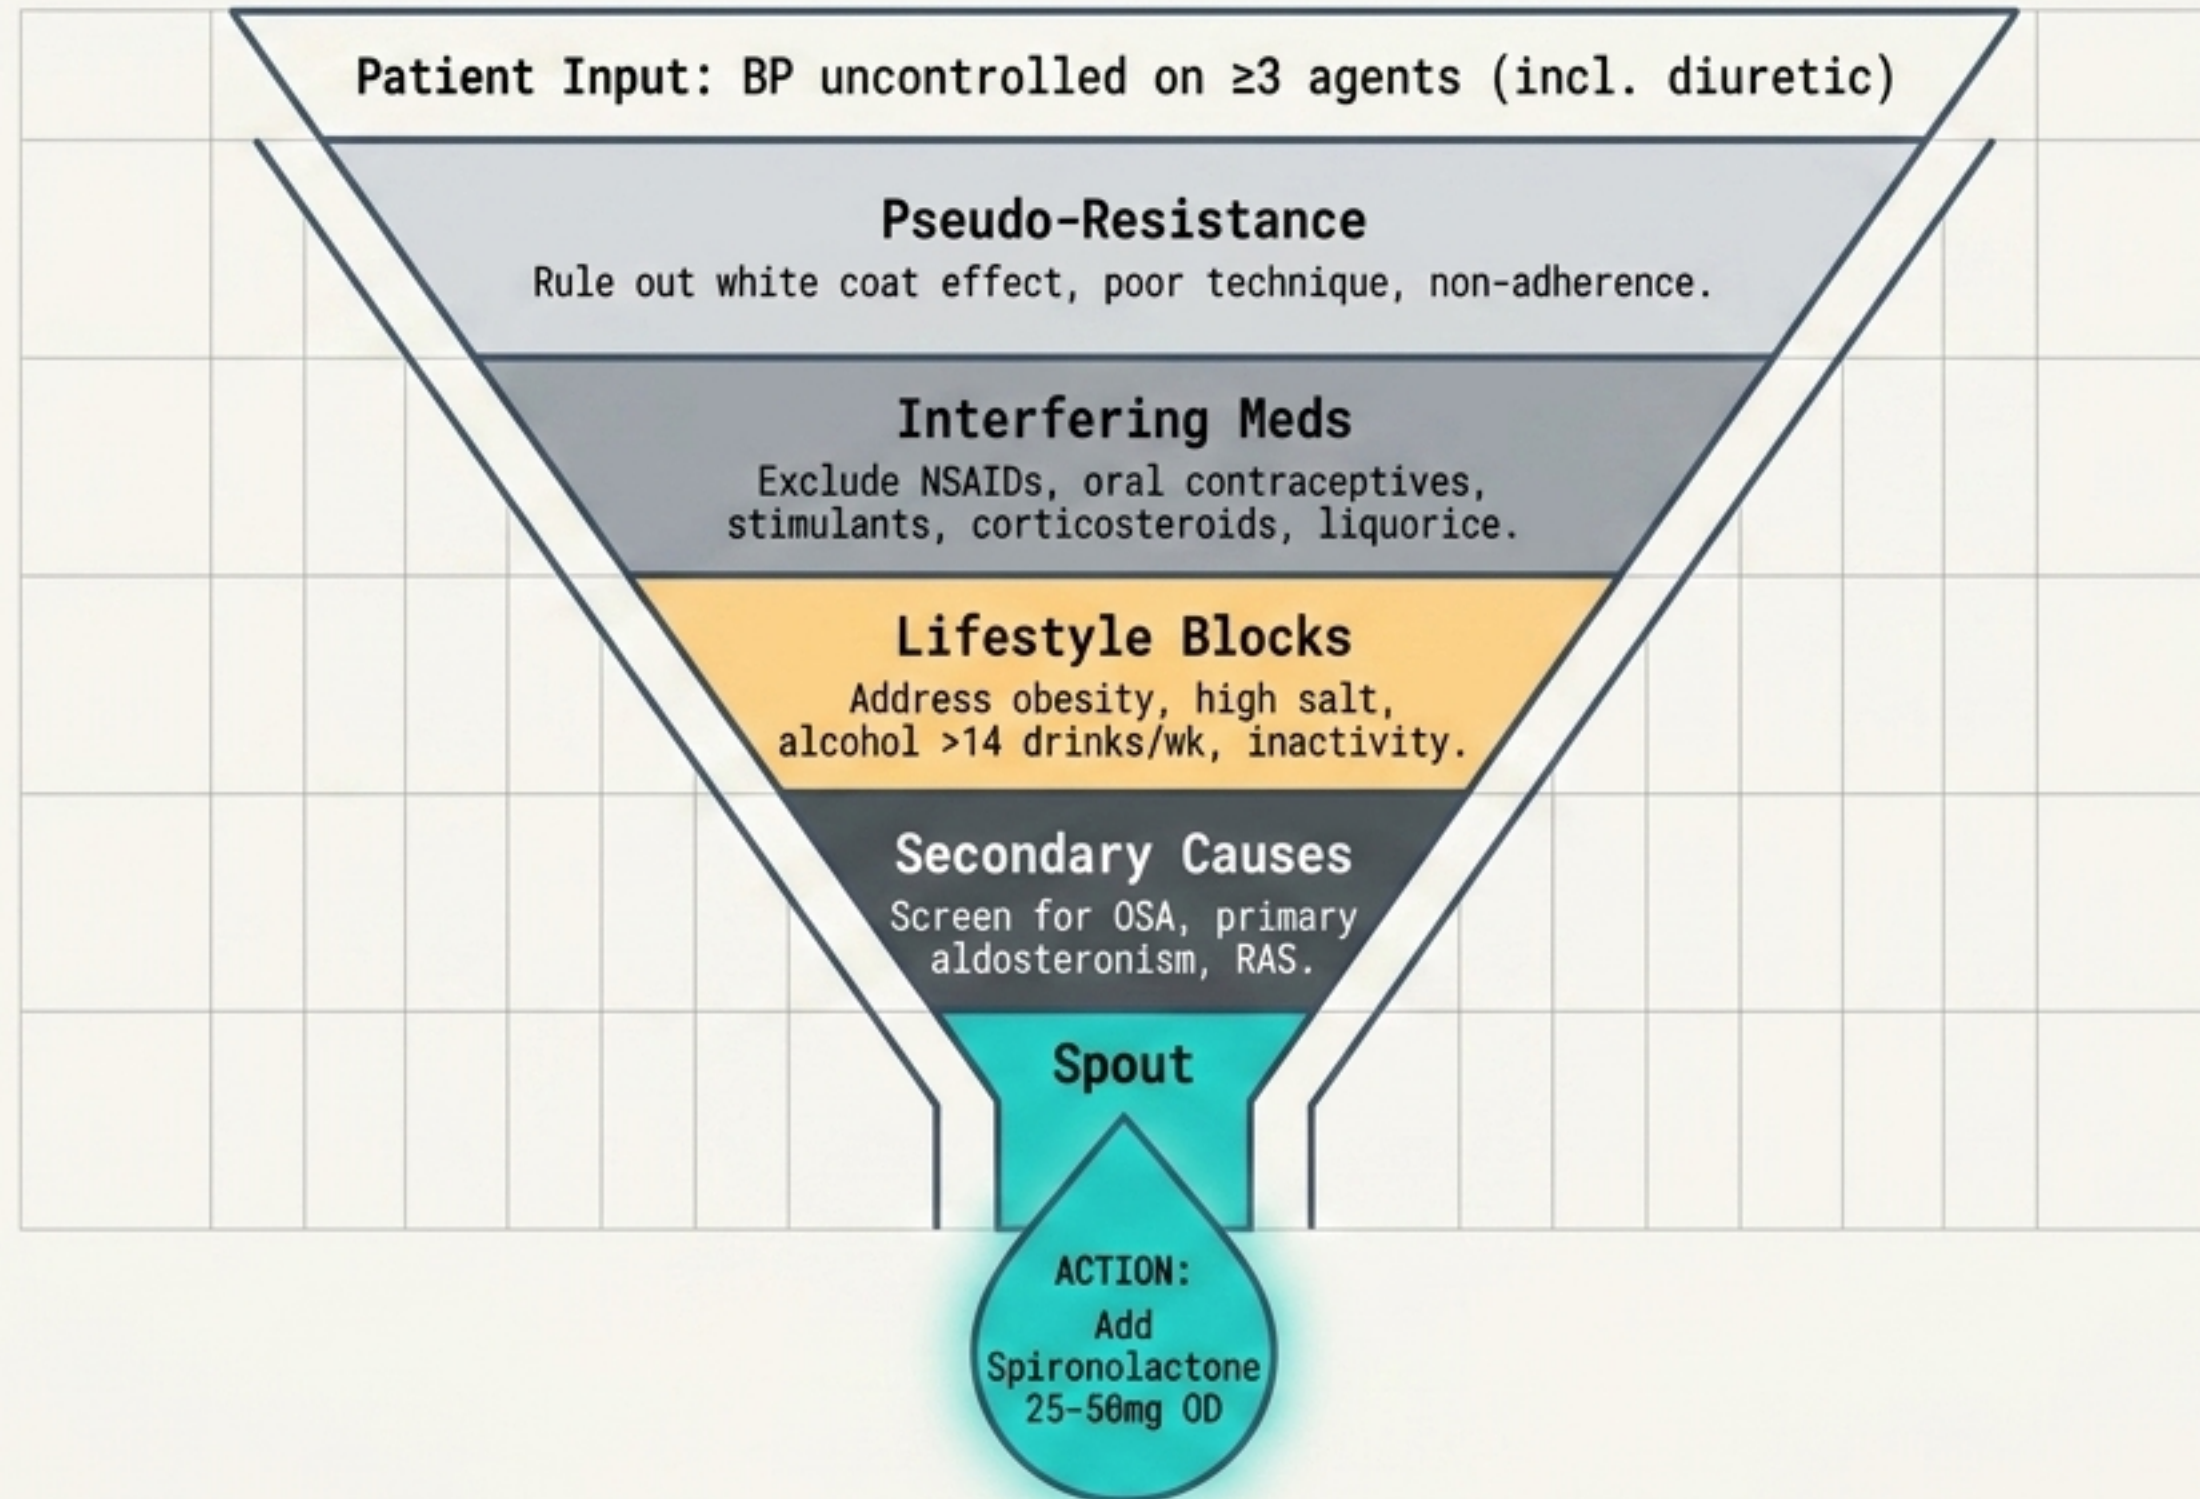

Mechanism of Harm

Dual blockade of the renin-angiotensin system causes severe **hyperkalaemia**, profound **hypotension**, and **Acute Kidney Injury (AKI)**.

Evidence Base

The **ONTARGET Trial** definitively demonstrated increased adverse effects with absolutely zero cardiovascular benefit.

The Resistant Hypertension Elimination Funnel

(4th-line agent, per PATHWAY-2 trial. Avoid if eGFR <30).

Anomalies: Screening for Secondary Hypertension

Trigger Criteria

SCREEN IF:

- Onset <30 yrs
- Sudden worsening HTN
- Resistant HTN
- Hypertensive crisis ($\geq 180/120$)

The Secondary Hypertension Sleuth Matrix

Condition	Clinical Clues	Screening Test	Definitive Treatment
Primary Aldosteronism	Hypokalaemia.	Aldosterone-to-Renin Ratio (ARR).	Adrenalectomy or Spironolactone.
Renovascular (RAS)	Abdominal bruit, older atherosclerosis / young women (FMD).	Duplex US.	ACEi/ARB or Stenting.
Phaeochromocytoma	Episodic headache, sweating, palpitations.	Plasma-free metanephrines.	Alpha then beta-blockade, surgery.
OSA	Snoring, daytime somnolence, BMI ≥ 30 .	Polysomnography.	CPAP (yields 2-3 mmHg drop).

The Primary Suspects: Aldosteronism & Renovascular

Primary Aldosteronism (Conn's Syndrome)

Prevalence: 5-15% (Underdiagnosed in Aus).

Positive screen if ARR >70 pmol/mIU with PAC >400 pmol/L.

MEDICATION INTERFERENCE:

 Spironolactone, ACEi, ARBs, diuretics interfere with renin/aldosterone. Withhold for ≥4 weeks (6 for spironolactone) before testing if safe.

Renovascular Hypertension (RAS)

Demographics: Atherosclerotic (>60yo) vs Fibromuscular Dysplasia (<50yo women).

Imaging: Duplex Renal US is 1st-line (85-90% sensitivity). CTA/MRA for anatomical mapping.

EVIDENCE NOTE: Routine stenting for atherosclerotic RAS shows no benefit over medical therapy (ASTRAL/CORAL trials).

Phaeochromocytoma: The Alpha-Before-Beta Rule

The Alpha-Before-Beta Sequential Lock

THE RULE:
NEVER start a
beta-blocker before
adequate
alpha-blockade.

THE MECHANISM:

Unopposed alpha-receptor stimulation will precipitate a catastrophic hypertensive crisis.

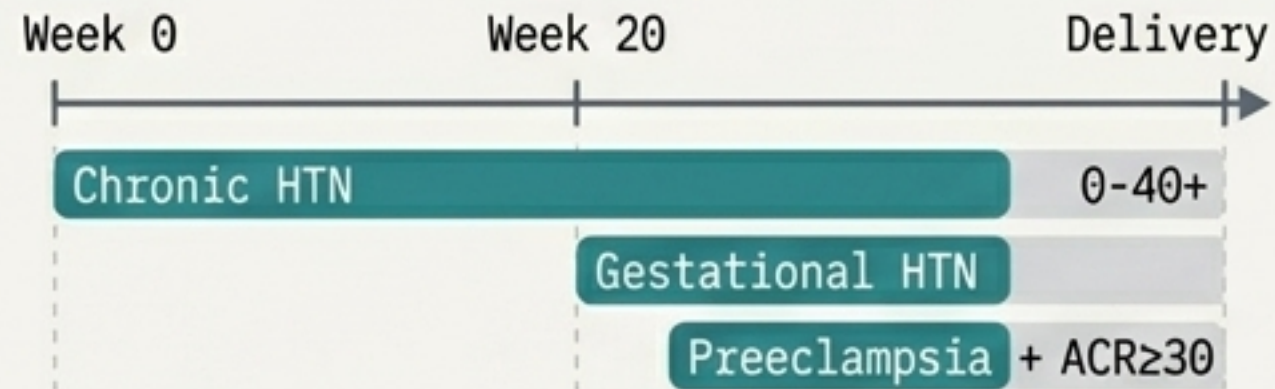

THE PROTOCOL:

Initiate pre-operative
alpha-blockade
(Phenoxybenzamine 10-40mg BD
or Doxazosin) for 10-14 days
FIRST.

Only then can a beta-blocker be
safely introduced.

Special Populations: Maternal & Paediatric Care

Pregnancy

Targets: 110-135/80-85 mmHg.

Arsenal: Methyldopa (Max 2g/d),
Labetalol (PBS Authority),
Nifedipine MR.

CRIMSON ALERT:
! ACEi & ARBs are strictly teratogenic (renal dysgenesis). Cease pre-conception or immediately upon pregnancy.

Paediatrics

Definition: BP \geq 95th percentile for age/sex/height.

Causes: <12 years mostly renal (70-80%); adolescents mostly primary.

Action: Confirm oscillometric screens with auscultatory method. Refer to paediatric nephrologist.

Special Populations: Age & Systemic Impairment

Elderly (≥ 65)

- Check for orthostatic hypotension (Systolic drop ≥ 20 , Diastolic drop ≥ 10).
- Avoid high-dose thiazides (hyponatraemia) and centrally-acting clonidine.
- Target guided by Clinical Frailty Scale.

Chronic Kidney Disease

- ACEi/ARB mandatory if ACR ≥ 30 mg/mmol.
- Expect up to 30% initial creatinine rise. Do NOT cease unless rise $>30\%$ or $K^+ > 6.0$.
- Use Loop diuretics if eGFR < 30 .

Hepatic & Transplant

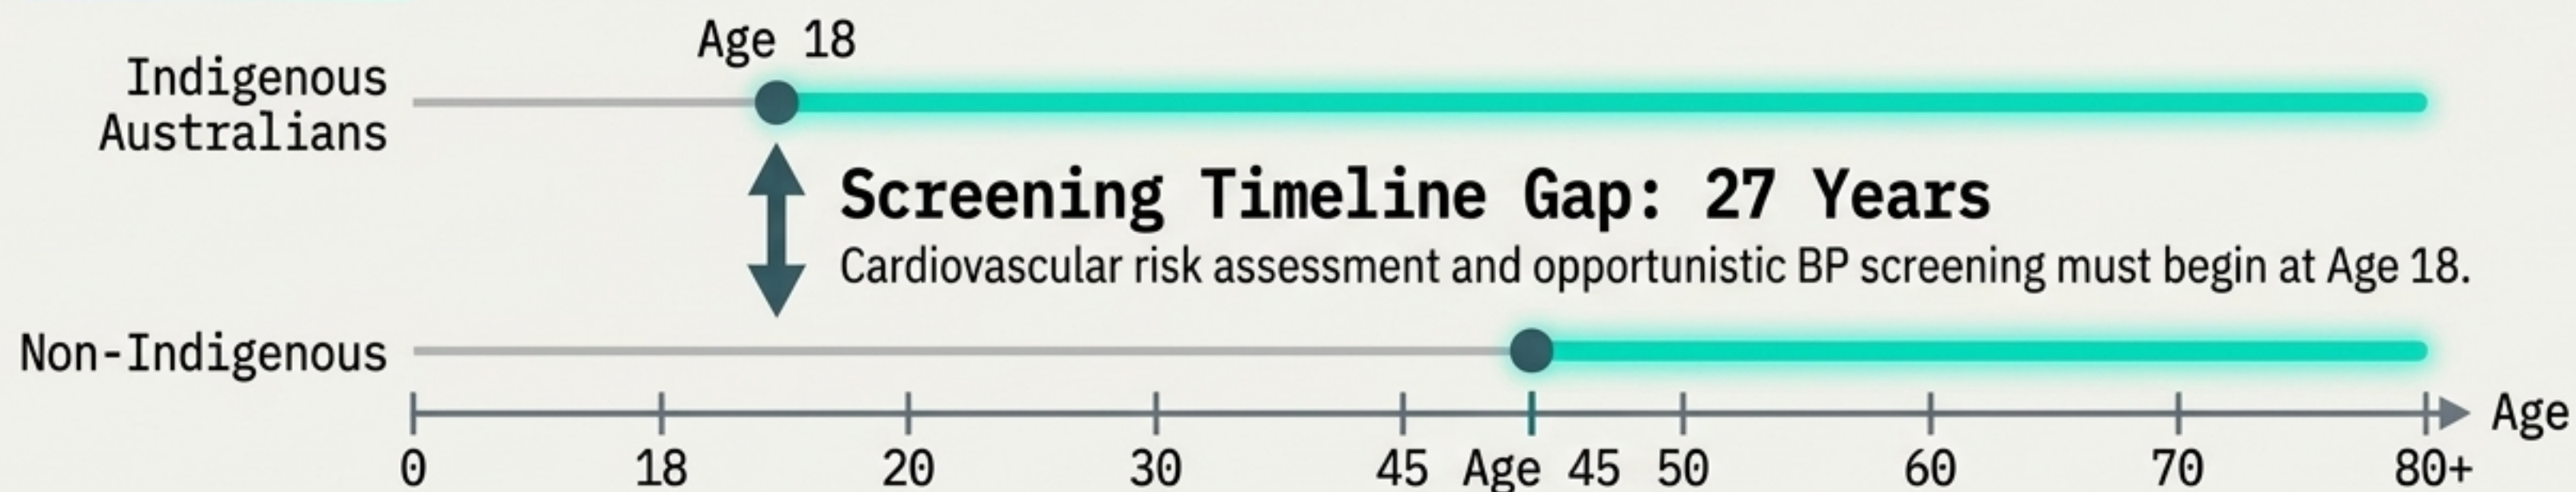

- HEPATIC: Amlodipine preferred (start 2.5mg). Avoid high-dose diuretics (precipitates encephalopathy).
- TRANSPLANT: Avoid non-DHP CCBs (diltiazem, verapamil) as they inhibit CYP3A4, spiking tacrolimus/ciclosporin levels.

The Disparity Gap: Indigenous Health Burden

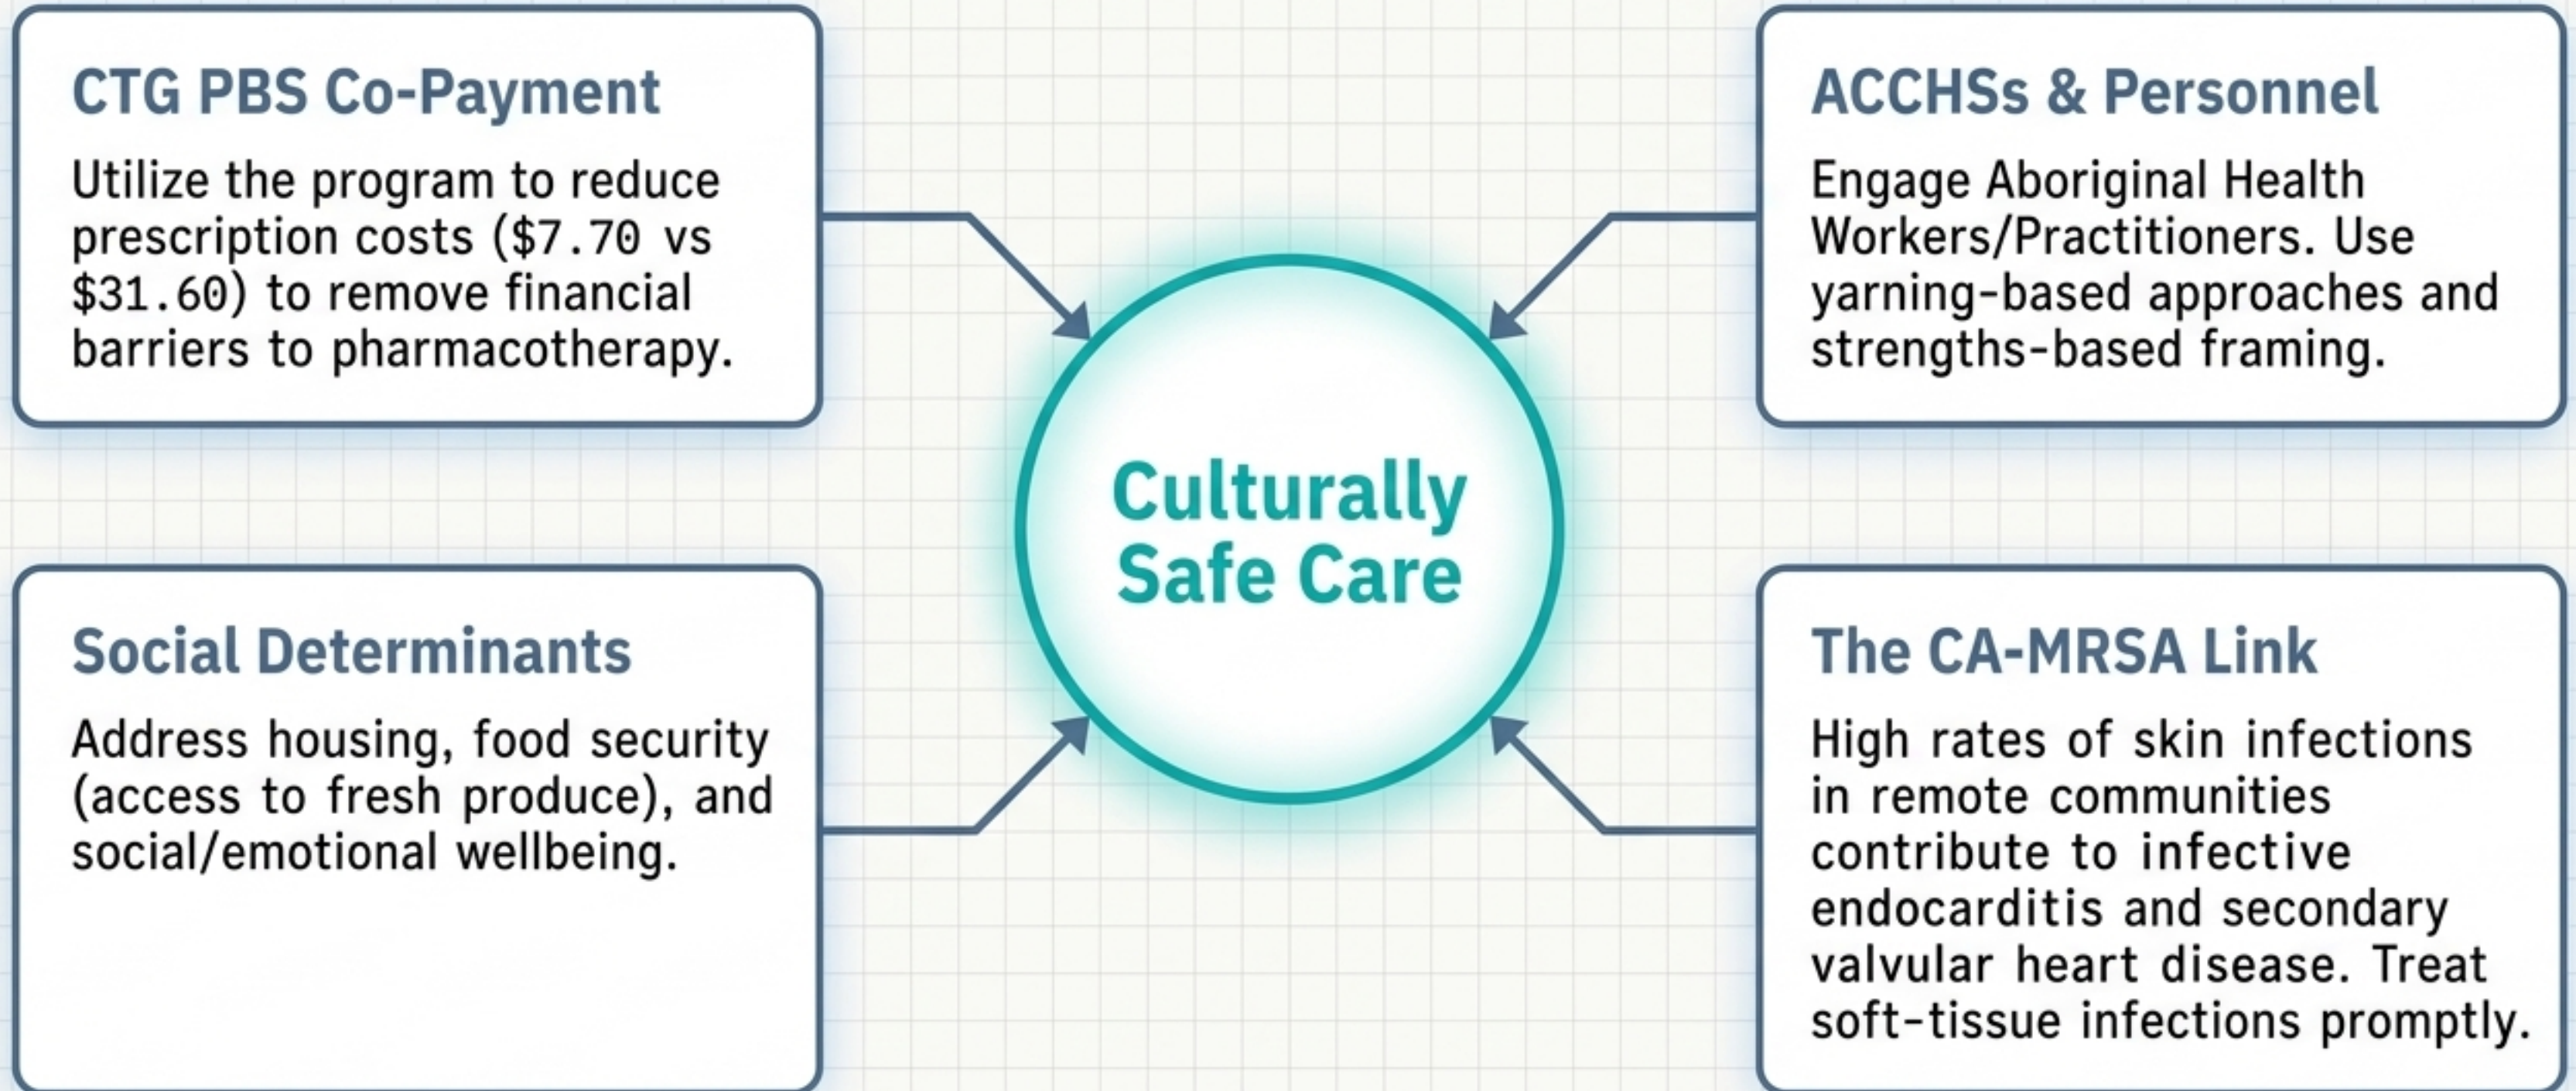

The Multiplier: Aboriginal and Torres Strait Islander peoples experience hypertension at **1.3 – 1.6x** the rate of non-Indigenous Australians.

Comparative Dual-Timeline

End-Organ Impact: Indigenous Australians suffer **7-8 times** the rate of dialysis-requiring ESKD. Annual eGFR and urine ACR screening is **mandatory**.

Closing the Gap: Culturally Safe Management

The Stratified Stepped-Care Blueprint

Elevated Office BP

Confirm with ABPM/HBPM.

Classify Risk & Target (General $<130/80$, Elderly ≥ 80 $130-149$, etc.)

Base Layer \rightarrow Lifestyle modification (DASH, Weight, Sodium)

Step 1 \rightarrow Monotherapy (ACEi/ARB/CCB/Thiazide)

Step 2 \rightarrow Single-Pill Combination (e.g., ACEi + CCB)

Step 3 \rightarrow Add Thiazide-like diuretic

⚠ Step 4 (Resistant) \rightarrow Rule out pseudo/secondary causes \rightarrow Add Spironolactone
